Using ArcObjects in Python

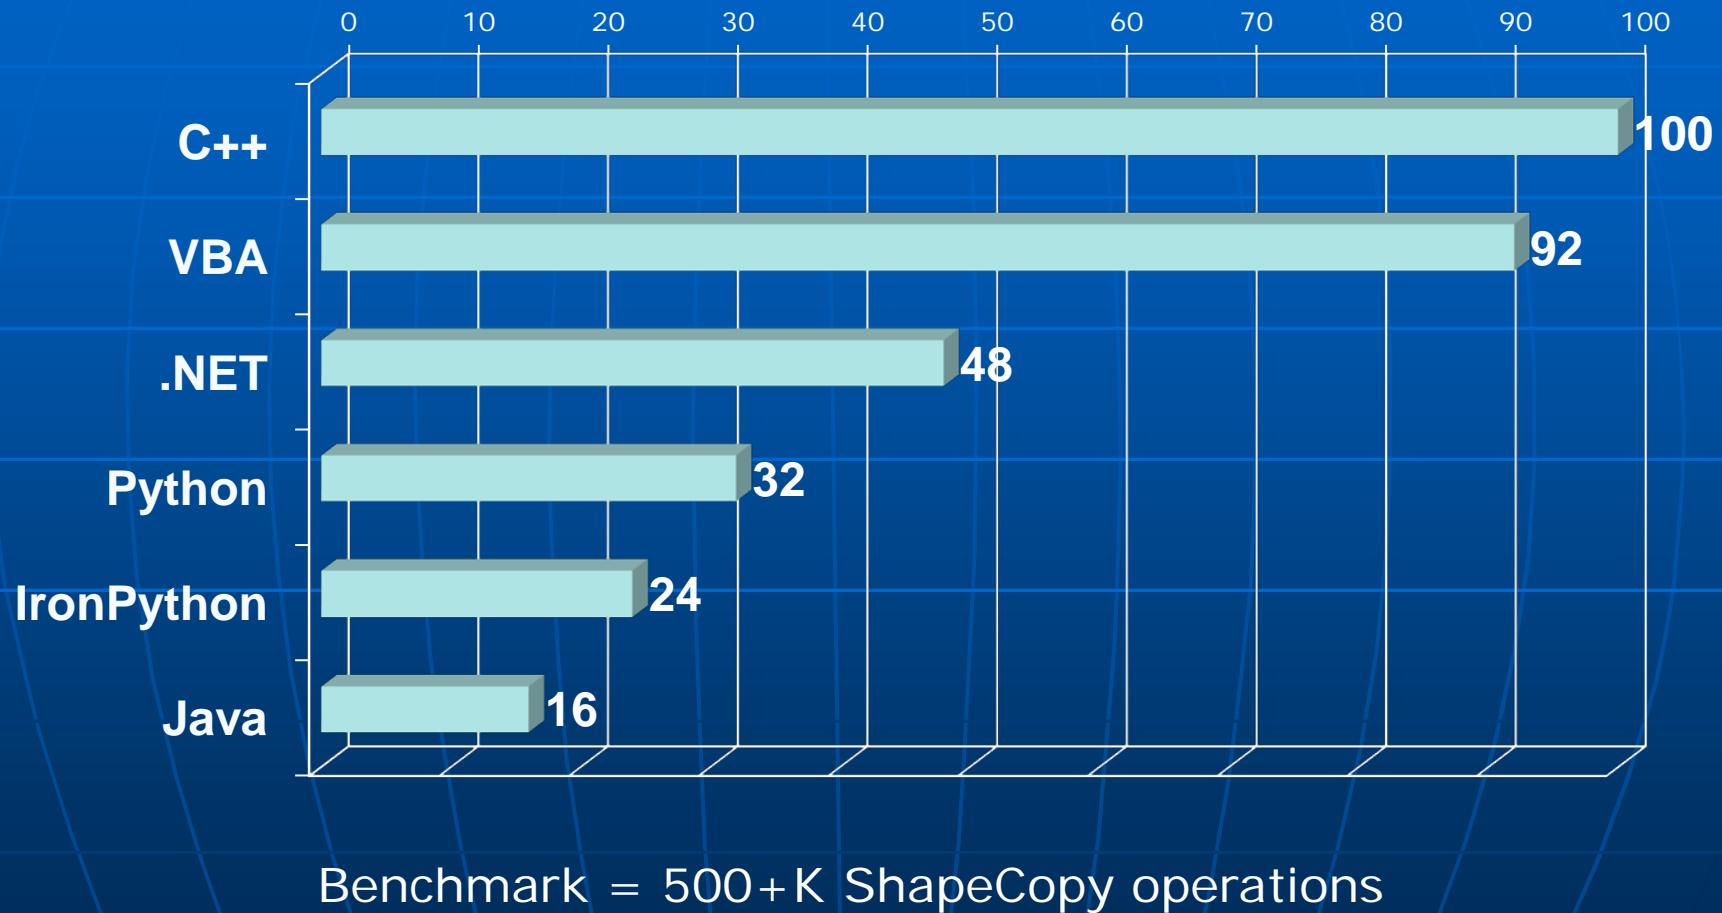

Esri Developer Summit 2010

ArcMap and Python: Closing the VBA Gap
Tuesday 4:30 Mesquite C

Extend Python Using C++ and ArcObjects
Wednesday 11:15 Mesquite B

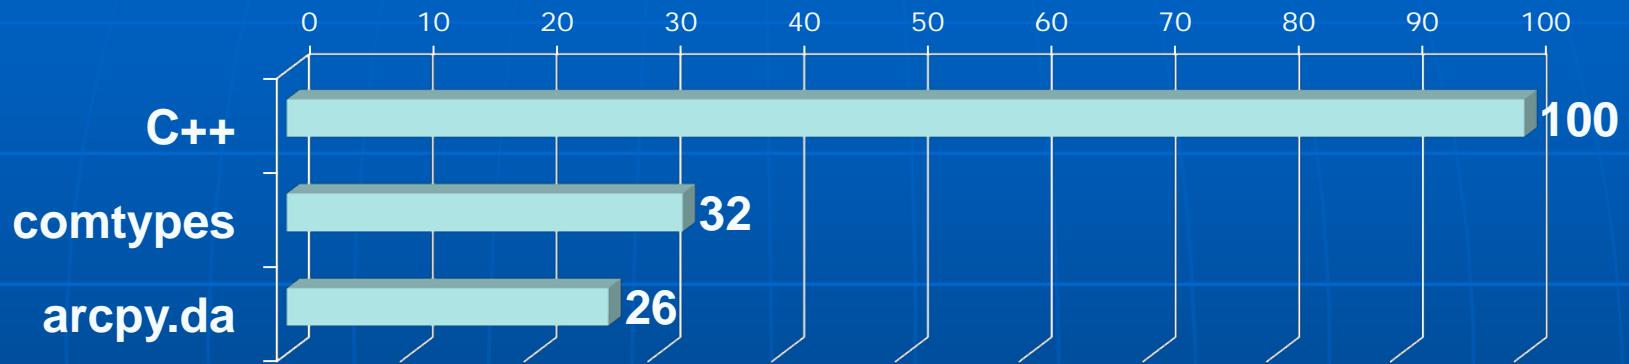

Download presentations and code:
<http://www.pierssen.com/arcgis10/python.htm>

COM Interop: relative speed

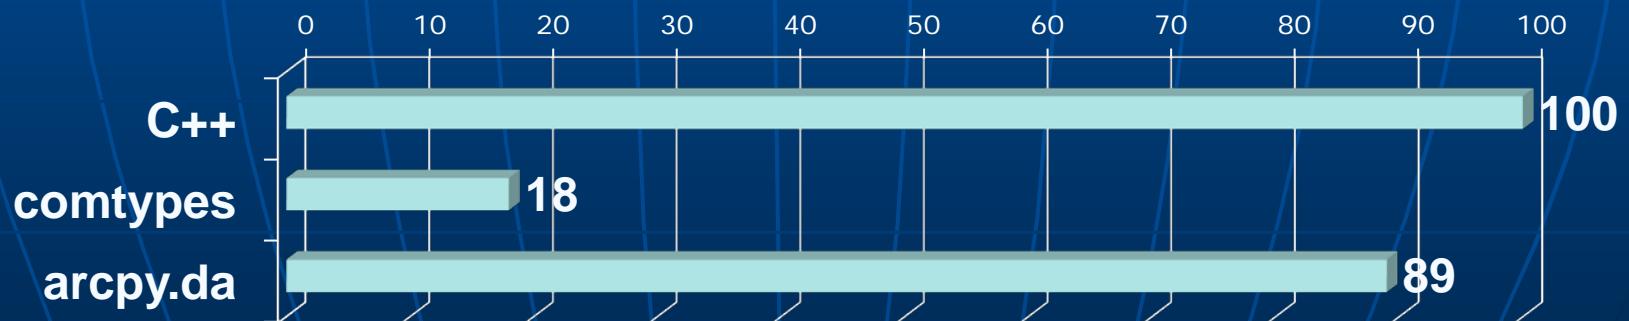

Don't forget arcpy.da (at 10.1)

Querying polygon geometry:

Querying SHAPE_AREA:

Options to extend Python:

- COM/ATL + comtypes: No longer recommended
- Python/C API: Create C Python module (.pyd)
 - SWIG, Cython: Automatically generate wrapper code to create a pyd
- ctypes: Create wrapper code on the Python side

Extending Python with C or C++:

<http://docs.python.org/extending/extending.html>

ArcObjects in Visual C++:

http://help.arcgis.com/en/sdk/10.0/arcobjects_net/conceptualhelp/index.html#/Appendix_ArcObjects_in_Visual_C/000100000n8q000000/

[All sample code and walkthroughs assume ArcGIS 10.1 pre-release with Python 2.7]

Free Visual C++ downloads:

- Visual C++ 2008 Express (required for Cython installation)
<http://www.microsoft.com/download/en/details.aspx?id=20682>
- Visual C++ 2010 Express
<http://www.microsoft.com/visualstudio/en-us/products/2010-editions/visual-cpp-express>
- Sample code and walkthroughs assume VC 2008E
- All walkthroughs tested successfully in VC 2010E (with minor modifications involving project variables)
- Express versions do not have ATL or MFC

Testing for memory leaks in VC Express:

```
#ifdef _DEBUG
    _CrtMemState s1, s2, s3;
    _CrtMemCheckpoint(&s1);

#endif
    char * sResult = MyFunction(sMyArg);
#ifdef _DEBUG
    _CrtMemCheckpoint(&s2);
    if (_CrtMemDifference(&s3, &s1, &s2))
    {
        OutputDebugString(L"Allocated blocks found:\n");
        _CrtMemDumpAllObjectsSince(&s1);
    }
#endif
```

In this example, only one block should be allocated

Walkthrough 1: Creating a Python module in Visual C++

[Sample Code: PythonC/standalonedemo]

An example C++ class:

```
// demo.h
#include <string>
using namespace std;
class demo
{
private:
    bool _initialized;
    string _sResult;
public:
    demo();
    bool Init();
    char * Inventory(char * Workspace, char * FeatureClass);
private:
    void DoIt(char * ws, char * fc);
};
```

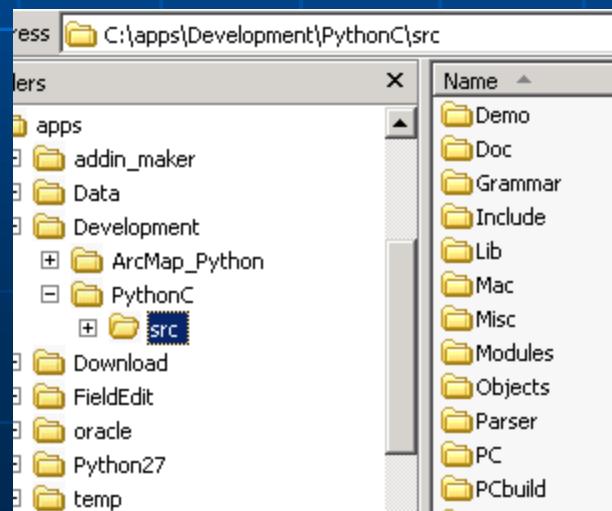

Step 1: Set up Python development package

- Download and unzip Python 2.7 source code package:

<http://www.python.org/ftp/python/2.7.2/Python-2.7.2.tgz>

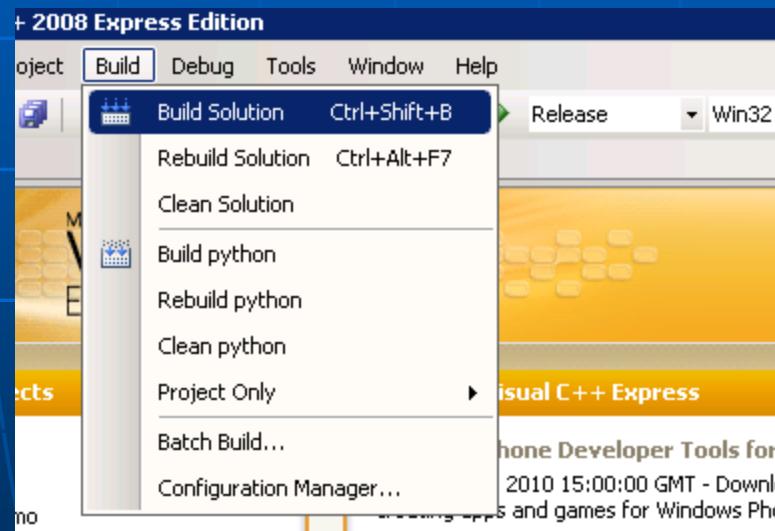

[Download actually has a ".tar" extension which must be changed to ".tgz" for WinZip to handle it properly]

- Create a folder called "src" adjacent to where you intend to create Python extension projects
- Move contents of "Python-2.7.2" folder to src folder

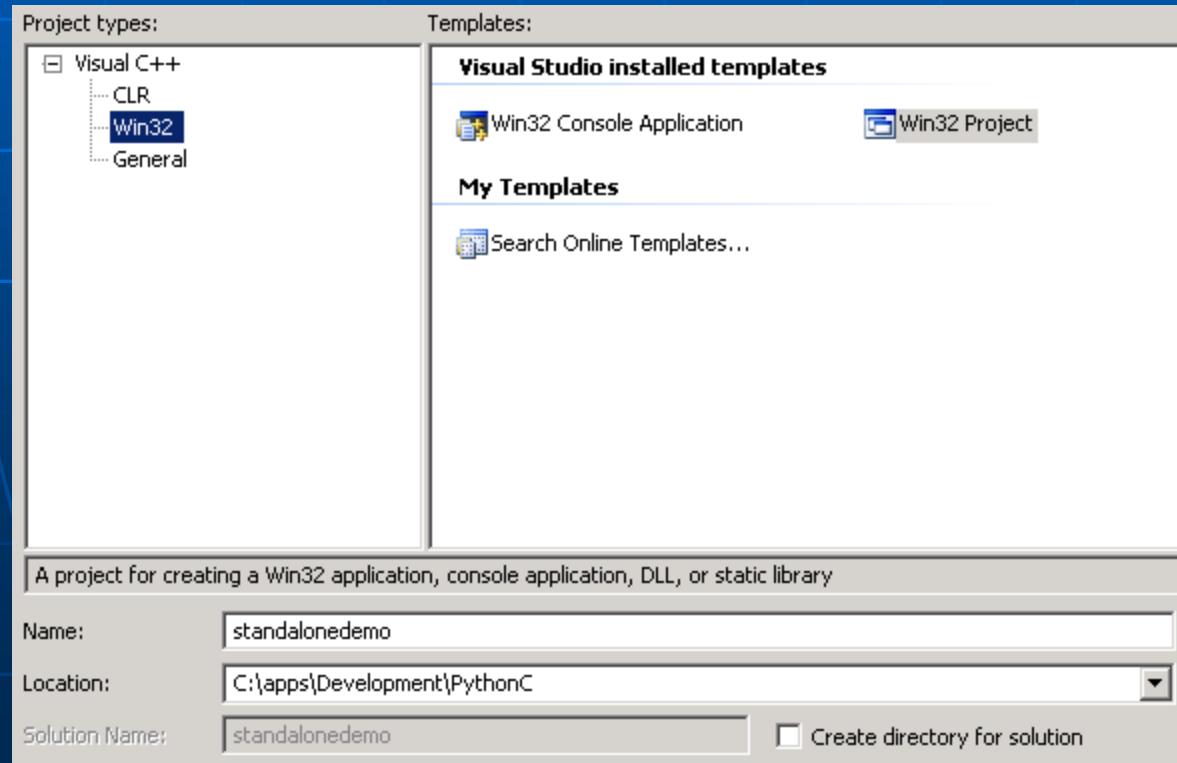

Step 1 (continued)

- Open src\PCbuild\pcbuild.sln in Visual C++
- Build solution in both "Debug" and "Release" configurations (ignore errors), creating python27_d.lib and python27.lib

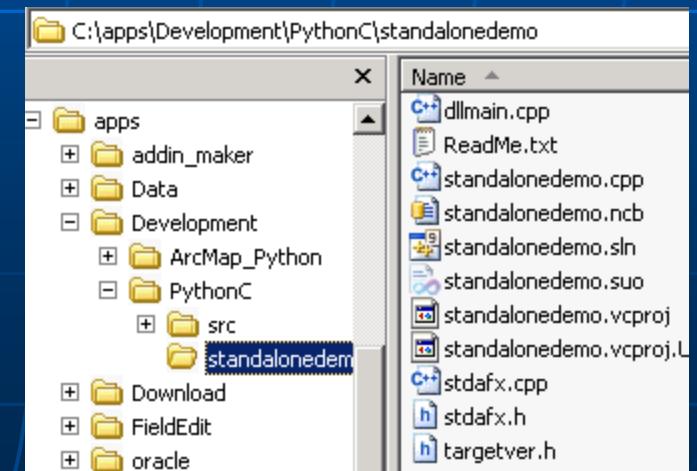

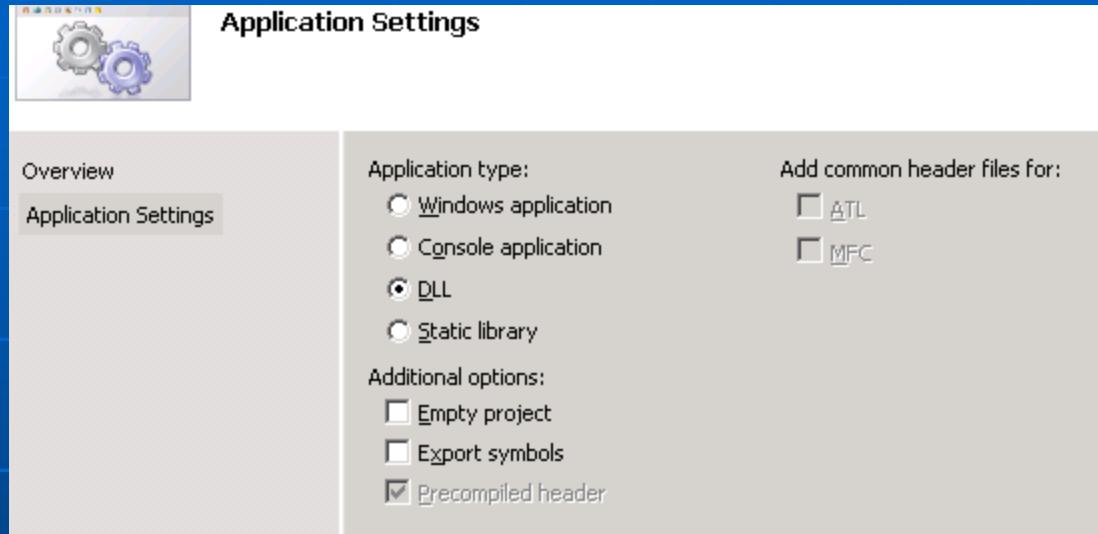

Step 2: Create a new Visual C++ project

- Project type: Win32 Project
- Name: standalonedemo
- Uncheck “Create directory for solution”
- Location: desired project folder (same level as src)

Step 2 (continued)

■ Application type: DLL

Step 2 (continued)

Properties (All Configurations)

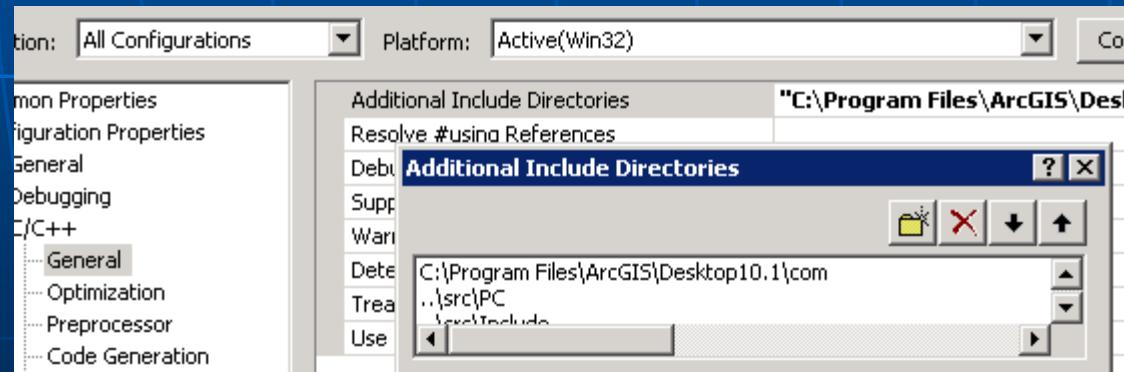

C/C++ | General | Additional Include Directories:

..\\src\\Include

..\\src\\PC

[C:\\Program Files*]\\ArcGIS\\Desktop10.1\\com

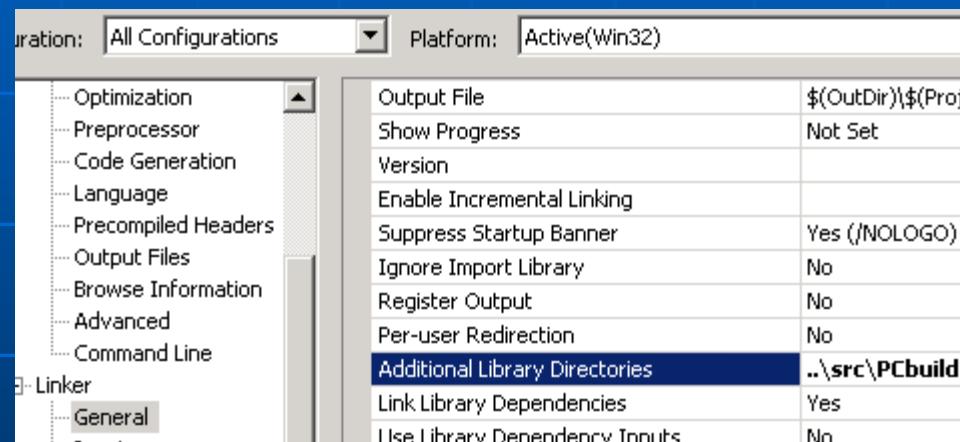

*wherever ArcGIS is installed

Step 2 (continued)

■ Properties (All Configurations)

Linker|General|Additional Library Directories:
..\\src\\PCbuild

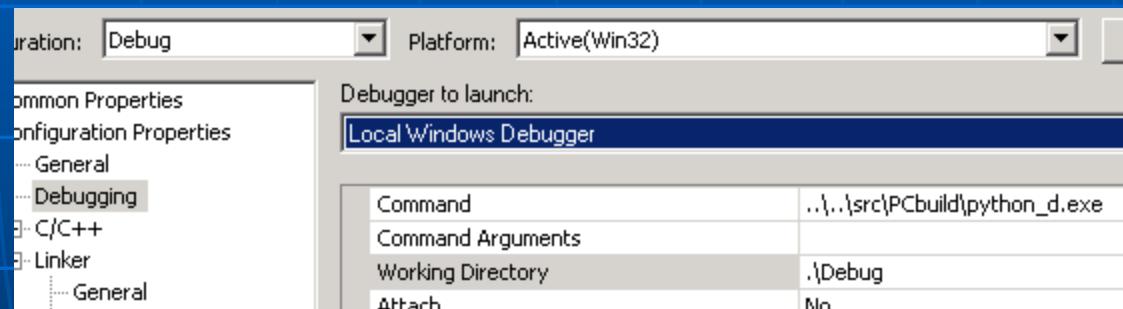

Step 2 (continued)

■ Properties (Debug)

Debugging|Command:

..\\..\\src\\PCbuild\\python_d.exe

Debugging|Working Directory: .\\Debug

Step 2 (continued)

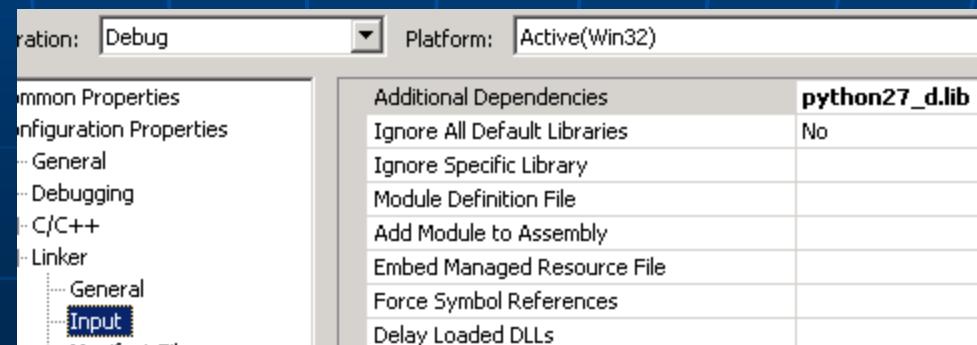

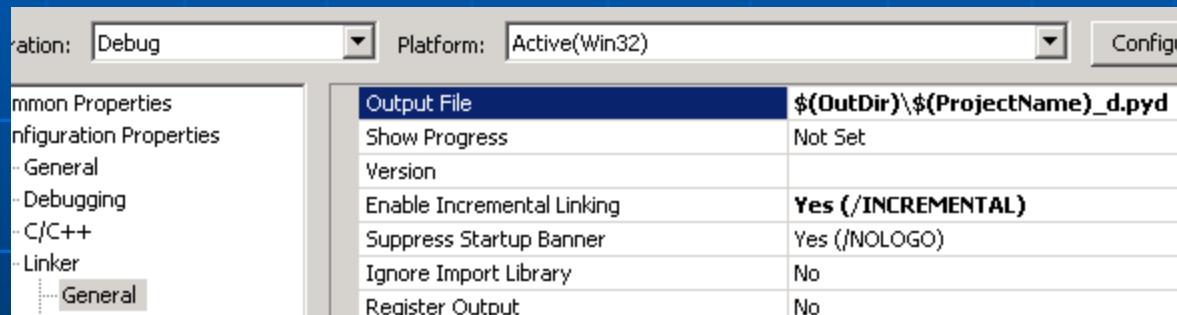

Properties (Debug)

Linker|General|Output File:

`$(OutDir)\$(ProjectName)_d.pyd`

Linker|Input|Additional Dependencies:

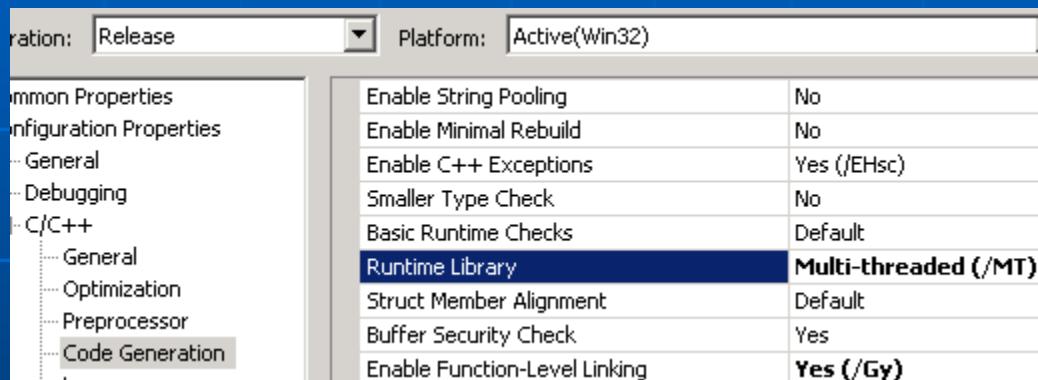

`python27_d.lib`

Step 2 (continued)

Properties (Release)

C/C++ | Code Generation | Runtime Library: Multi-threaded (/MT)

Step 2 (continued)

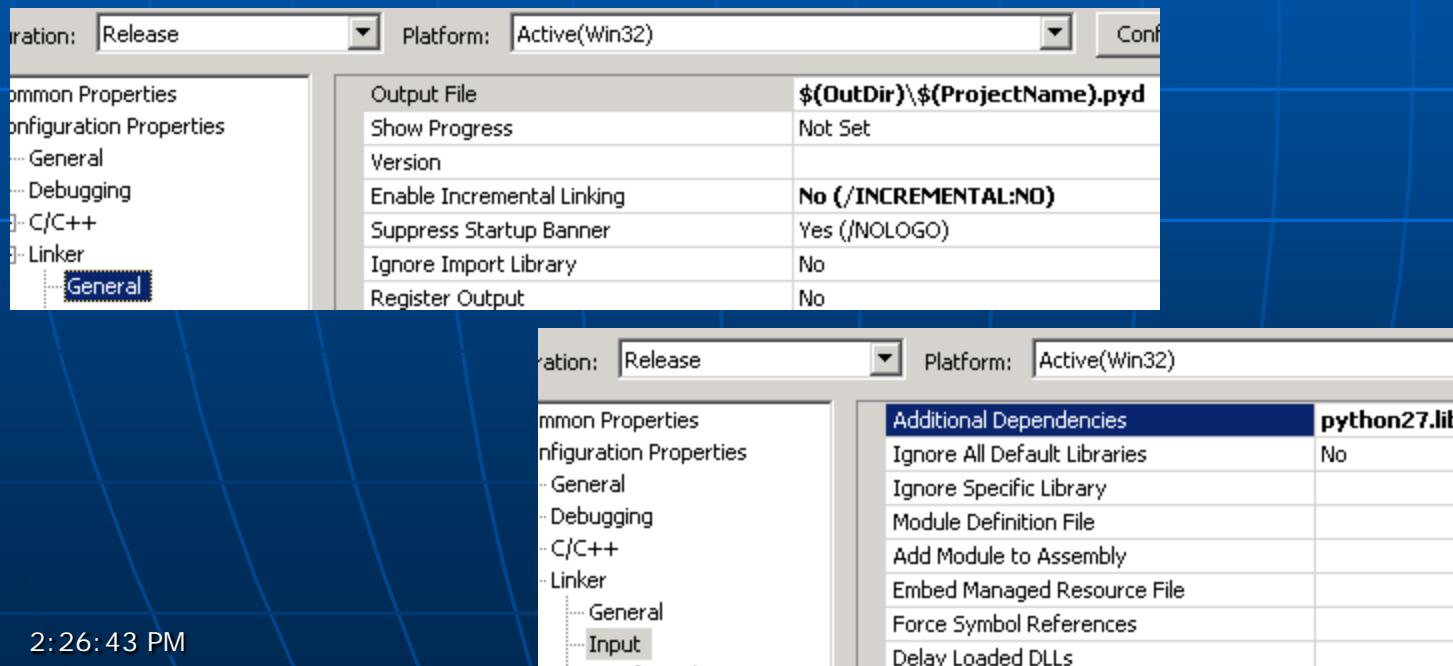

Properties (Release)

Linker|General|Output File:

`$(OutDir)\$(ProjectName).pyd`

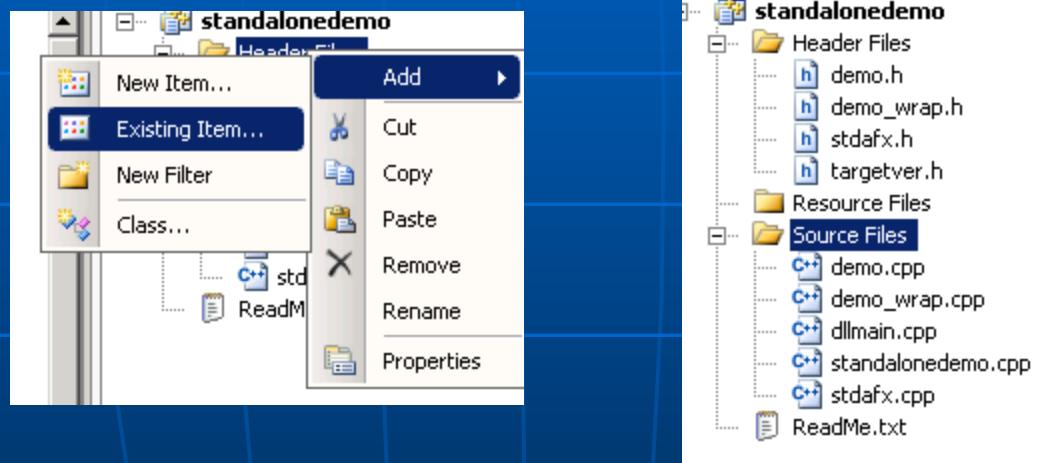

Linker|Input|Additional Dependencies:

`python27.lib`

Step 3: Run Debug configuration

- Copy demo.h, demo.cpp, demo_wrap.h, demo_wrap.cpp into project and add as existing items

Step 3 (continued)

■ Add sample code for stdafx.h

```
// TODO: reference additional headers your program requires here
#import "libid:6FCCEDE0-179D-4D12-B586-58C88D26CA78" no_namespace raw_
    rename("esriProductCode", "esriVersionProductCode") rename("VersionI
#import "esriFramework.olb" raw_interfaces_only raw_native_types no_nam
#import "esriSystem.olb" raw_interfaces_only raw_native_types no_nam
#import "esriSystemUI.olb" raw_interfaces_only raw_native_types no_nam
#import "esriEditor.olb" raw_interfaces_only raw_native_types no_nam
#import "esriGeodatabaseUI.olb" raw_interfaces_only raw_native_types no_nam
#import "esriArcMapUI.olb" raw_interfaces_only raw_native_types no_nam
#import "esriGeometry.olb" raw_interfaces_only raw_native_types no_nam
#import "esriDisplay.olb" raw_interfaces_only raw_native_types no_nam
#import "esriGeoDatabase.olb" raw_interfaces_only raw_native_types no_nam
#import "esriDataSourcesFile.olb" raw_interfaces_only raw_native_types
#import "esriDataSourcesRaster.olb" raw_interfaces_only raw_native_type
#import "esriDataSourcesGDB.olb" raw_interfaces_only raw_native_types r
#import "esriCarto.olb" raw_interfaces_only raw_native_types no_namespac
#import "esriEditorExt.olb" raw_interfaces_only raw_native_types no_nam
#import "esriNetworkAnalysis.olb" raw_interfaces_only raw_native_types
#import "esriOutput.olb" raw_interfaces_only raw_native_types no_nam
#import "esriOutputUI.olb" raw_interfaces_only raw_native_types no_nam
|
```

Step 3 (continued)

- Add sample code for standalonedemo.cpp

```
#include "stdafx.h"
#include <Python.h>
#include "demo_wrap.h"

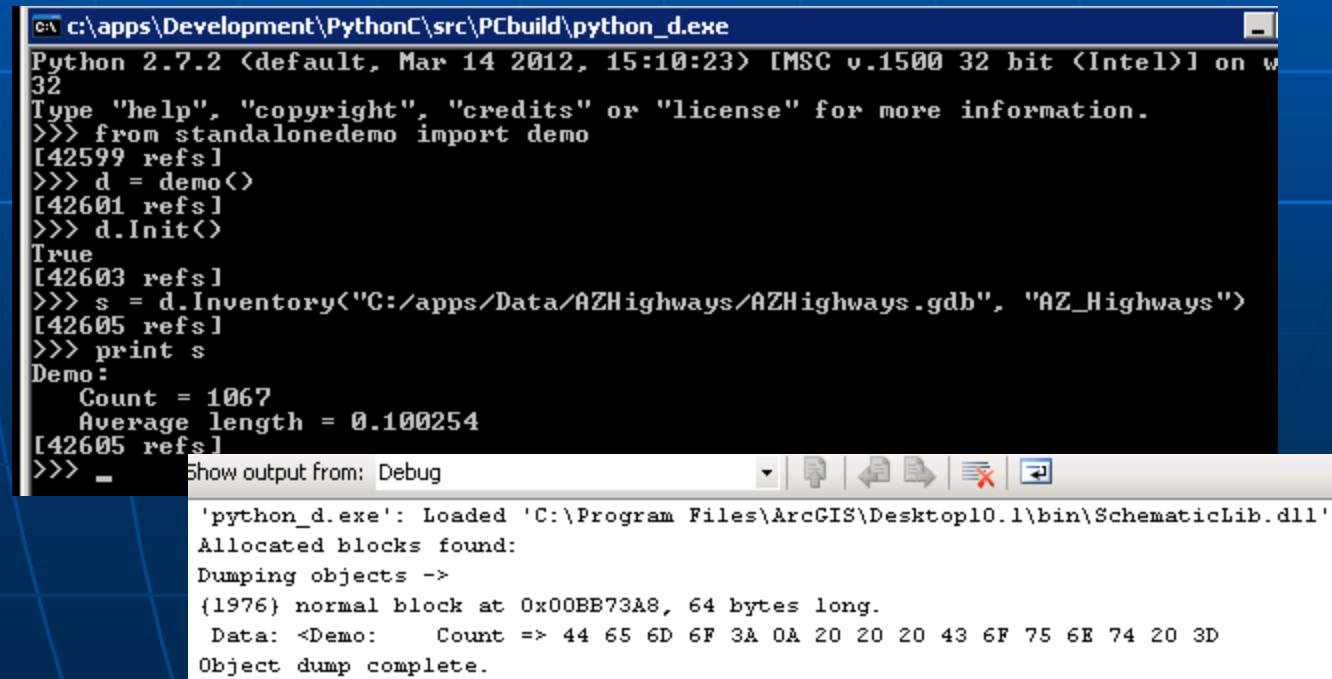

static PyMethodDef module_methods[] = {{NULL}}; // No module-level methods

PyMODINIT_FUNC
initstandalonedemo(void)
{
    PyObject* m;
    if (PyType_Ready(&DemoType) < 0)
        return;
    m = Py_InitModule3("standalonedemo", module_methods,
                      "Example module that creates an extension type.");
    if (m == NULL)
        return;
    Py_INCREF(&DemoType);
    PyModule_AddObject(m, "demo", (PyObject *) &DemoType);
}
```

Step 3 (continued)

- Have a shapefile or file geodatabase handy
- Build and run:

```
>>> from standalone demo import demo  
>>> d = demo()  
>>> d.Init()  
>>> s =  
d.Inventory("C:/apps/Data/AZHighways/AZHighways.gdb",  
"AZ_Highways")  
>>> print s
```

The screenshot shows a Windows command prompt window titled 'c:\apps\Development\PythonC\src\PCbuild\python_d.exe'. The window displays the following Python session:

```
Python 2.7.2 (default, Mar 14 2012, 15:10:23) [MSC v.1500 32 bit (Intel)] on win32
Type "help", "copyright", "credits" or "license" for more information.
>>> from standalone demo import demo
[42599 refs]
>>> d = demo()
[42601 refs]
>>> d.Init()
True
[42603 refs]
>>> s = d.Inventory("C:/apps/Data/AZHighways/AZHighways.gdb", "AZ_Highways")
[42605 refs]
>>> print s
Demo:
    Count = 1067
    Average length = 0.100254
[42605 refs]
>>> _
```

Below the command prompt, there is a status bar with the text 'Show output from: Debug' and a scroll bar. At the bottom of the window, there is a message box containing the following text:

```
'python_d.exe': Loaded 'C:\Program Files\ArcGIS\Desktop10.1\bin\SchematicLib.dll'
Allocated blocks found:
Dumping objects ->
{1976} normal block at 0x00BB73A8, 64 bytes long.
Data: <Demo: Count => 44 65 6D 6F 3A 0A 20 20 20 43 6F 75 6E 74 20 3D
Object dump complete.
```

demo_wrap.h:

```
#include "demo.h"

typedef struct
{
    PyObject_HEAD;
    demo *demo;
} Demo;

extern PyTypeObject DemoType;

PyObject * Demo_new(PyTypeObject *type, PyObject *args,
                    PyObject *kwds);
PyObject * Demo_Init(Demo *self);
PyObject * Demo_Inventory(Demo *self, PyObject *args);
void Demo_dealloc(Demo* self);
```

demo_wrap.cpp:

```
#include "stdafx.h"
#include <Python.h>
#include "demo_wrap.h"

PyMethodDef Demo_methods[] = {
    {"Init", (PyCFunction)Demo_Init, METH_NOARGS,
     "demo.Init(): Initialize COM and ArcObjects"},
    {"Inventory", (PyCFunction)Demo_Inventory,
     METH_VARARGS,
     "demo.Inventory(string ws, string fc):
inventory feature class fc in workspace ws"},
    {NULL}
};
```

demo_wrap.cpp (continued):

```
PyTypeObject DemoType = {  
    PyObject_HEAD_INIT(NULL)  
    0,                                /*ob_size*/  
    "standalone demo",      /*tp_name*/  
    sizeof(Demo),           /*tp_basicsize*/  
    0,                                /*tp_itemsize*/  
    (destructor)Demo_dealloc, /*tp_dealloc*/  
    ...  
    Py_TPFLAGS_DEFAULT | Py_TPFLAGS_BASETYPE, /*tp_flags*/  
    "demo object",          /*tp_doc*/  
    ...  
    Demo_methods,           /*tp_methods*/ // Methods only  
    0,                      /*tp_members*/ // No properties  
    ...  
    Demo_new,               /*tp_new*/  
};
```

demo_wrap.cpp (continued):

```
PyObject * Demo_new(PyTypeObject *type, PyObject
*args, PyObject *kwds)
{
    Demo *self;
    self = (Demo *) type->tp_alloc(type, 0);
    if (self != NULL)
    {
        self->demo = new demo();
        if (self->demo == NULL)
        {
            Py_DECREF(self);
            return NULL;
        }
    }
    return (PyObject *) self;
}

void Demo_dealloc(Demo* self)
{
    delete self->demo;
    self->ob_type->tp_free((PyObject*)self);
}
```

demo_wrap.cpp (continued):

```
PyObject * Demo_Init(Demo *self)
{
    if (self->demo == NULL)
        return NULL;
    bool bResult;
    try
    {
        bResult = self->demo->Init();
    }
    catch(...)
    {
        bResult = false;
    }
    if (!bResult)
    {
        Py_INCREF(Py_False);
        return Py_False;
    }
    Py_INCREF(Py_True);
    return Py_True;
}
```

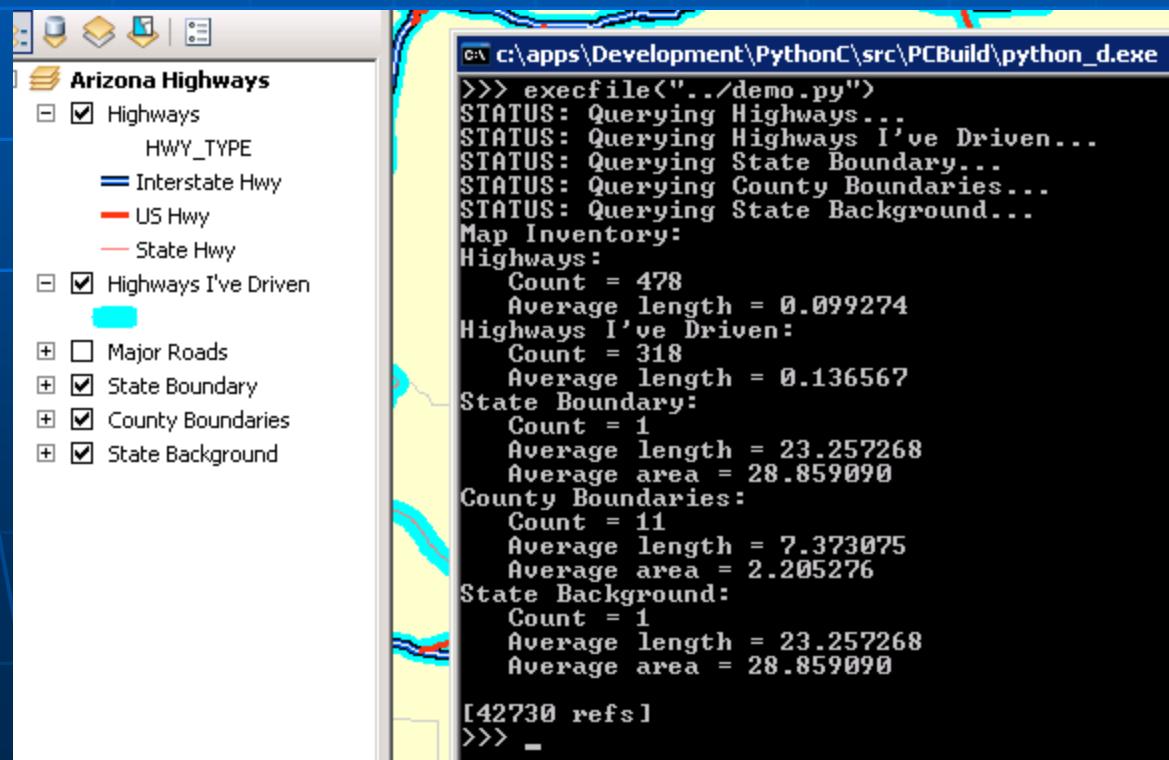

demo_wrap.cpp (continued):

```
PyObject * Demo_Inventory(Demo *self, PyObject *args)
{
    if (self->demo == NULL)
        return NULL;
    const char *ws, *fc;
    if (!PyArg_ParseTuple(args, "ss", &ws, &fc))
    {
        printf("Usage: demo.Inventory((string) workspace,
(string) featureclass)\n");
        return NULL;
    }
    char *s = self->demo->Inventory((char *)ws, (char *)fc);
    PyObject * pyResult = Py_BuildValue("s", s);
    return pyResult;
}
```

Debugging with python_d

- Cannot use site packages
- Cannot debug inside ArcMap
- However, you can use automation for debugging

[Sample Code: PythonC/arcmapdemo]

The screenshot shows a desktop environment with two windows. On the left is the ArcMap application interface, displaying a map of Arizona with various highway layers selected. On the right is a terminal window titled 'c:\apps\Development\PythonC\src\PCBuild\python_d.exe' showing the output of a Python script named 'demo.py'. The script performs spatial queries on the 'Arizona Highways' feature class, printing statistics for different road types and boundaries.

```
>>> execfile("../demo.py")
STATUS: Querying Highways...
STATUS: Querying Highways I've Driven...
STATUS: Querying State Boundary...
STATUS: Querying County Boundaries...
STATUS: Querying State Background...
Map Inventory:
Highways:
    Count = 478
    Average length = 0.099274
Highways I've Driven:
    Count = 318
    Average length = 0.136567
State Boundary:
    Count = 1
    Average length = 23.257268
    Average area = 28.859090
County Boundaries:
    Count = 11
    Average length = 7.373075
    Average area = 2.205276
State Background:
    Count = 1
    Average length = 23.257268
    Average area = 28.859090
[42730 refs]
>>> -
```

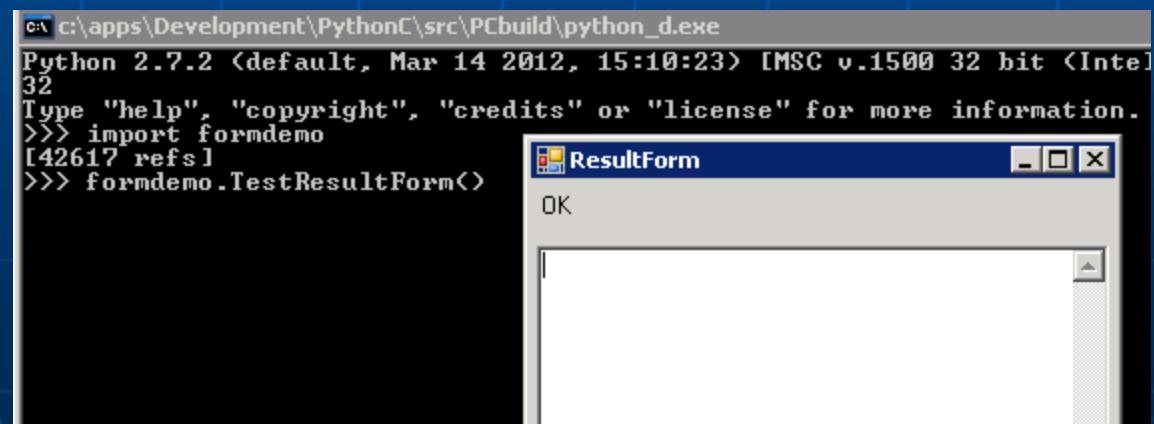

Can you incorporate .NET (CLR) forms?

- Yes, but there are several potential pitfalls
- Keep ArcObjects in unmanaged code!!!

```
#pragma managed(push, off) .... #pragma managed(pop)
```

- RECOMMENDED: Put forms in a separate pyd
- Better yet, why not use wxPython instead?

[Sample Code: PythonC/formdemo]

Why use SWIG or Cython?

Pros:

- Useful for wrapping existing code
- Save time creating wrapper code for new code

Cons:

- Create baggage
- Still require Python development package
- Still must debug in python_d
- Cannot directly consume and return ArcObjects

Why use SWIG?

Pros:

- Supports multiple languages: same C++ can be wrapped for Python and C#
- No compilation required - just unzip and use
- Fast, easy setup: for many cases requires just a few lines of configuration code

Cons:

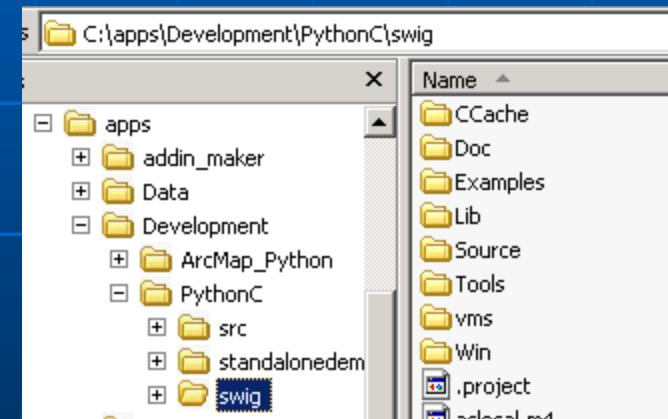

- Produces a python wrapper along with the pyd
- Requires creating typemap wrapper code for Python objects
- Does not support callbacks to Python

Walkthrough 2: Creating a Python module using SWIG

[Sample Code: PythonC/swigdemo]

Step 1: Set up SWIG

- Set up Python development package as in walkthrough #1 step 1
- Download `swigwin-2.0.4.zip`
<http://www.swig.org/download.html>
- Unzip `swigwin-2.0.4.zip` to temporary folder
- Create a folder called "swig" adjacent to where you intend to create Python extension projects
- Move contents of `swigwin-2.0.4` folder to `swig` folder

Step 2: Create project

- Create a new project as in walkthrough #1 step 2, called swigdemo
- Properties (debug)
Linker|General|Output File: \$(OutDir)_\$(ProjectName)_d.pyd
- Properties (release)
Linker|General|Output File: \$(OutDir)_\$(ProjectName).pyd
- Add new items: swigdemo.i, and swigdemo_wrap.cpp
- Right-click swigdemo.i and bring up Properties (All Configurations)
Custom Build Setup|General|Command Line:

```
..\swig\swig.exe -c++ -python -o  
$(ProjectDir)\$(InputName)_wrap.cpp $(InputPath)
```

Custom Build Setup|General|Outputs:
\$(ProjectDir)\\$(InputName)_wrap.cpp
- Right-click swigdemo_wrap.cpp and bring up Properties (All Configurations)
C/C++|Precompiled Headers|Create/Use Precompiled Header: Not Using Precompiled Headers

Step 3: Build and run Debug configuration

- Copy demo.h and demo.cpp into project and add as existing items
Add sample code for stdafx.h and swigdemo.i
- Build Debug configuration
- Copy swigdemo.py to Debug folder
- Run python_d:

```
>>> from swigdemo import demo
>>> d = demo()
>>> d.Init()
>>> s =
d.Inventory("C:/apps/Data/AZHi ghways/AZHi ghways..gdb",
"AZ_Hi ghways")
>>> print s
```

Why use Cython?

Pros:

- Produces a standalone pyd
- Produces cleaner C wrappers

Cons:

- To install, Cython uses distutils to compile pyds
- Distutils expects VC 2008 unless you tweak it
- Requires writing some wrapper code (in Pyrex)

Walkthrough 3: Creating a Python module using Cython

[Sample Code: PythonC/cythondemo]

Step 1: Set up Cython

- Set up Python development package as in walkthrough #1 step 1
- Download Cython-0.15.1.zip
<http://cython.org/release/Cython-0.15.1.zip>
- Unzip to temporary folder
- Verify that Visual C++ 2008 is installed
- Open a command prompt and cd to folder containing setup.py
`python setup.py install`

Step 2: Create project

- Create a new project as in walkthrough #1 step 2, called cythondemo
- Make sure python is in the PATH environment
- Add new items: cythondemo.pyx, and cythondemo_wrap.cpp
- Right-click cythondemo.pyx and bring up Properties (All Configurations)

Custom Build Setup|General|Command Line:

```
python -c "from Cython.Compiler.Main import compile;  
compile('cythondemo.pyx', output_file='$(InputName)_wrap.cpp',  
cplus=True)"
```

Custom Build Setup|General|Outputs:

```
$(ProjectDir)\$(InputName)_wrap.cpp
```

- Right-click cythondemo_wrap.cpp and bring up Properties (All Configurations)
C/C++ | Precompiled Headers | Create/Use Precompiled Header: Not Using Precompiled Headers

Step 3: Build and run Debug configuration

- Copy demo.h and demo.cpp into project and add as existing items
Add sample code for stdafx.h and cythondemo.pyx
- Build Debug configuration
- Run python_d:

```
>>> from cythondemo import PyDemo
>>> d = PyDemo()
>>> d.Init()
>>> s =
d.Inventory("C:/apps/Data/AZHighways/AZHighways.gdb",
"AZ_Highways")
>>> print s
```

“And now for something
completely different....”

Why use ctypes?

Pros:

- No Python development package required
- Code can be debugged inside an ArcMap session
- Can easily consume and return comtypes-wrapped ArcObjects
- The DLL produced can be used in both Python and .NET

Cons:

- Only C exported functions can be used by ctypes: C++ objects cannot be directly exposed

Installing comtypes and wxPython and creating Python add-ins

Presentation:

ArcMap and Python: Closing the VBA Gap

ctypes – A foreign function library
for Python

<http://docs.python.org/library/ctypes.html>

Walkthrough 4: Creating a helper module for ArcMap using ctypes

[Sample Code: PythonC/ctdemo]

The maphelper class:

```
// maphelper.h
#include <string>
using namespace std;
typedef void *StatusCallback(char * msg);
class maphelper
{
private:
    StatusCallback *_pStatusCall;
    string _sResult;
public:
    maphelper();
    void Init(StatusCallback *pStatusCall);
    IMap * GetFocusMap();
    char * Inventory(IMap * ipMap, IEnvelope * ipExtent);
private:
    void IntMapInventory(IMap * ipMap, IEnvelope * ipExtent);
    void Status(string sMsg);
};
```

Step 1: Create project

- Project type: Win32 Project
Name: ctdemo
Uncheck "Create directory for solution"
Application type: DLL
- Properties (all configurations)
C/C++ | General | Additional Include Directories:
[C:\Program Files*]\ArcGIS\Desktop10.1\com
*wherever ArcGIS is installed
- Properties (debug)
Debugging | Command:
[C:\Program Files*]\ArcGIS\Desktop10.1\bin\ArcMap.exe
*wherever ArcGIS is installed
- Properties (release)
C/C++ | Code Generation | Runtime Library: Multi-threaded (/MT)

Step 2: Run Debug configuration

- Copy the following into project and add as existing items:
maphelper.h, maphelper.cpp
- Add sample code for stdafx.h and ctdemo.cpp
- Copy ctdemo.py and demo.py to project folder
- Build and run:

Open an mxd

Open ArcMap's Python window

```
>>> sProjPath = "c:/apps/Development/PythonC/ctdemo"  
>>> execfile(sProjPath + "/demo.py")
```

The screenshot shows a ArcMap interface with a map titled "zona Highways". The map displays various road types: Interstate Hwy (blue), US Hwy (red), State Hwy (pink), and Major Roads (cyan). A legend on the left lists "Highways", "HWY_TYPE", "Interstate Hwy", "US Hwy", "State Hwy", "Highways I've Driven", "Major Roads", "State Boundary", "County Boundaries", and "State Background". To the right of the map is a Python window with the following output:

```
>>> sProjPath =  
"c:/apps/Development/PythonC/ctdemo"  
>>> execfile(sProjPath + "/demo.py")  
STATUS: Querying Highways...  
STATUS: Querying Highways I've Driven...  
STATUS: Querying State Boundary...  
STATUS: Querying County Boundaries...  
STATUS: Querying State Background...  
Map Inventory:  
Highways:  
    Count = 675  
    Average length = 0.103588  
Highways I've Driven:  
    Count = 421
```

```
// ct demo. cpp

#include "stdafx.h"
#include "maphelper.h"

extern "C" __declspec( dllexport )
void * maphelper_New()
{
    maphelper *m = new maphelper;
    return (void *)m;
}

extern "C" __declspec( dllexport )
void maphelper_Init(void * self, StatusCallback *pStatusCall)
{
    maphelper *m = (maphelper*)self;
    m->Init(pStatusCall);
}
```

// ctdemo.cpp (continued)

```
extern "C" __declspec( dllimport )
char * maphelper_Inventory(void * self, IMap * ipMap,
IEnvelope * ipExtent)
{
    maphelper *m = (maphelper*)self;
    return m->Inventory(ipMap, ipExtent);
}

extern "C" __declspec( dllimport )
void maphelper_Delete(void * self)
{
    maphelper *m = (maphelper*)self;
    delete m;
}
```

```

# ctdemo.py
class mapelper_factory:
    _dll = None
    def __init__(self, path=None):
        from os import getcwd
        from ctypes import cdll # NOT windll!
        if not (self._dll is None):
            return
        if path is None:
            sPath = getcwd()
        else:
